

Mathematical Concepts 3

Exercise 1: Optimality in 2 dimensions

Let $f : \mathbb{R}^2 \rightarrow \mathbb{R}, (x_1, x_2) \mapsto -\cos(x_1^2 + x_2^2 + x_1x_2)$

- (a) Create a contour plot of f in the range $[-2, 2] \times [-2, 2]$ with \mathbb{R} .
- (b) Compute ∇f
- (c) Compute $\nabla^2 f$

Now, we define the restriction of f to $S_r = \{(x_1, x_2) \in \mathbb{R}^2 \mid x_1^2 + x_2^2 + x_1x_2 < r\}$ with $r \in \mathbb{R}, r > 0$, i.e., $f|_{S_r} : S_r \rightarrow \mathbb{R}, (x_1, x_2) \mapsto f(x_1, x_2)$.

- (d) Show that $f|_{S_{\bar{r}}}$ with $\bar{r} = \pi/4$ is convex.
- (e) Find the local minimum \mathbf{x}^* of $f|_{S_{\bar{r}}}$
- (f) Is \mathbf{x}^* a global minimum of f ?

Exercise 2: Optimality in d dimensions

Let \mathbf{X} be a d -dimensional random vector and let \mathbf{Y} be a one-dimensional random vector with $\text{Var}(\mathbf{X}) = \Sigma_{\mathbf{X}}$ and $\text{Cov}(\mathbf{X}, \mathbf{Y}) = \Sigma_{\mathbf{X}, \mathbf{Y}} \in \mathbb{R}^{d \times 1}$.

Further, let $f : \mathbb{R}^d \rightarrow \mathbb{R}, \mathbf{w} \mapsto \text{Var}(\mathbf{w}^\top \mathbf{X} - \mathbf{Y})$.

- (a) Show that f is convex.
- (b) Compute ∇f and $\nabla^2 f$
- (c) Under which condition exists a unique minimizer \mathbf{w}^* of f . Is this a global minimum? (if it exists)
- (d) Given the samples $(\mathbf{x}_i, y_i) \sim \mathbb{P}_{\mathbf{X}, \mathbf{Y}}$, under which condition is the least squares estimator a consistent estimator of \mathbf{w}^* in general?¹

¹This question is out of the scope of this lecture; however, it gives interesting insights into the entities we have computed.
